Definition of on accuracy

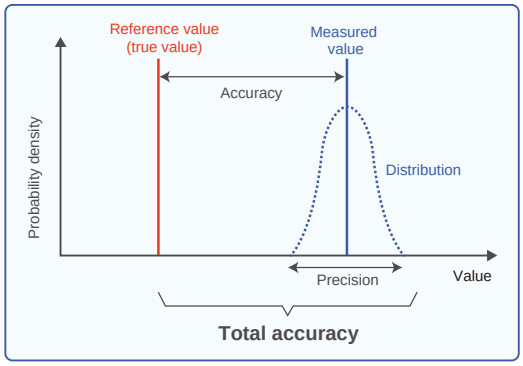
(total accuracy including uncertainty in calibration system etc.)

Reading (displayed value) error:
Indicates the value displayed by the instrument. Limit values for reading errors are expressed as a percentage of the reading (“% of reading” or “% rdg”).

Range error:
Indicates the instrument’s range. Limit values for range errors are expressed as a percentage of the range (“% of range”).

Full scale (rated current) error:
Indicates the rated current. Limit values for full-scale errors are expressed as a percentage of full scale (“% of full scale” or “% f.s.”).

Calibration:
The accuracy of HIOKI products includes all factors that affect the measurement results, such as calibration system errors, ambient temperature, and secular change, as “**uncertainty**”.



HIOKI is accredited as an official ISO/IEC 17025 calibrator.

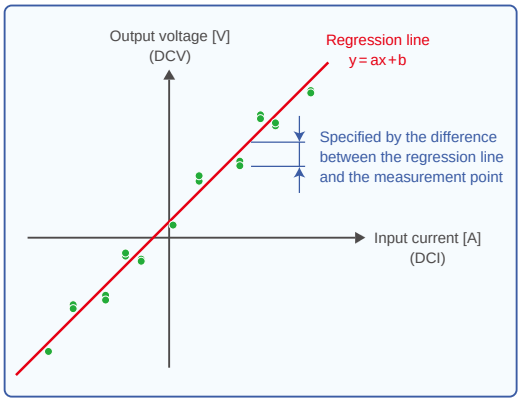
Definition of linearity error

Linearity error εL:
Indicates that the output (current or voltage) changes linearly in response to the input current.
A regression line is attained by measuring the output voltage in the sequence below in 10 A intervals:

+50 A → 0 A → −50 A → 0 A → +50 A

It is defined as the difference between the regression line calculated from the above measurements and the measurement points.



Definition of offset error

Offset error εO:
Specified by the ratio of the average value (µ) of the measured values of the offset voltage and the rated current (Imax) of each current sensor.

$$\varepsilon_O = \mu / Imax \ [\mathrm{ppm}]$$

Definition of amplitude error

Amplitude error εG:
An index showing the degree of flatness of the frequency characteristics of gain.
DC error is defined as (linearity error + offset error).
AC error is defined as deviation from the 55 Hz measurement point.

$$\varepsilon_{GDC} = \varepsilon_L + \varepsilon_O \ [\mathrm{ppm}]$$

$$\varepsilon_{GAC} = \frac{Gain\,(f) - Gain\,(55\ \mathrm{Hz})}{Gain\,(55\ \mathrm{Hz})} \times 100\ [\%]$$
